Reviews

This publication might be worthy of a read through, and superior to other. It normally is not going to charge excessive. Its been written in an remarkably simple way and is particularly just after i finished reading through this book through which in fact transformed me, alter the way i really believe.

Not illustrated. 1920 Excerpt: . . . to 1 cm. along the crests of the muscular ridges. The heart is otherwise normal. Lungs: Wt. 320 gm. Vol. 330 cc. The lungs are voluminous but not extremely so. Pleura is smooth, but looks thick and slightly opaque (edematous), giving the suggestion of a film over the lung. The lungs are unusually colored, being a dusky, bluish red or pink, distinctly cyanotic with a semi-translucent quality over all. Here and there are light, whitish patches, but these are neither large nor numerous (as in phosgene cases). In such patches there is crepitation, but practically everywhere else the lung is doughy arid airless (Fig. 1). On section, clear fluid and blood pour out like water from a squeezed sponge. The tissue is red and semi-translucent with occasional lighter, air-containing patches. Near the margins of the upper lobes, there are a few small emphysematous areas. The bronchi, like the lung proper, are full of fluid, and in the large branches, there is some froth. The mucosa is somewhat reddened, and that of the smallest branches is rather opaque. About each there is a zone of edema, which is also conspicuous about the larger blood vessels. The trachea is full of sticky froth. Its mucosa is slightly reddened but is otherwise normal. The remaining organs, --liver, spleen, kidneys, adrenals, gastrointestinal tract, brain, --are negative. Microscopic Findings: There is little worthy of note aside from the respiratory tract. The tracheal epithelium is practically everywhere intact, but in places the...
